. 2020. GFAR Ommitted Results. 1, 1 (August 2020), 19 pages. <https://doi.org/10.1145/nnnnnnnn.nnnnnnnn>

1 INTRODUCTION

This document contains the omitted results of our paper *Ensuring Fairness in Group Recommendations by Rank-Sensitive Balancing of Relevance*.

In our paper, due to space limitations, we only show the metric vs. group size plots for the zRecall metric; also we only show the results for the other metrics for group size $m = 8$.

2 MOVIELENS RESULTS

For the MovieLens dataset results see the following figures:

- For Recall metric, Figs. 1, 2 and 3 show the mean, min, minmax results for *Random*, *Divergent* and *Similar* groups respectively.
- For nDCG metric, Figs. 4, 5 and 6 show the mean, min, minmax results for *Random*, *Divergent* and *Similar* groups respectively.
- For DFH metric, Figs. 7, 8 and 9 show the mean, min, minmax results for *Random*, *Divergent* and *Similar* groups respectively.
- Tables 1, 2, 3, 4, 5, 6 shows all the results in table format for *Random*, *Divergent* and *Similar* groups, for group sizes $m = 2, 3, \dots, 7$ respectively.

Note that,for comparison we also included an analysis of the MAX strategy which has been shown to align with human preferences [1]. For the MovieLens dataset, GFAR always outperforms MAX. Out of 210 cases, there is only one case where MAX outperforms the worst performing baseline AVG for the MovieLens dataset, for the nDCG(mean) metric of the *Divergent* groups of size $m = 2$. These results suggest that MAX is not a suitable strategy for the task of fairness as predicted.

3 KGREC-MUSIC RESULTS

For the KGRec-Music dataset results see the following figures:

- For Recall metric, Figs. 10, 11 and 12 show the mean, min, minmax results for *Random*, *Divergent* and *Similar* groups respectively.

Manuscript submitted to ACM

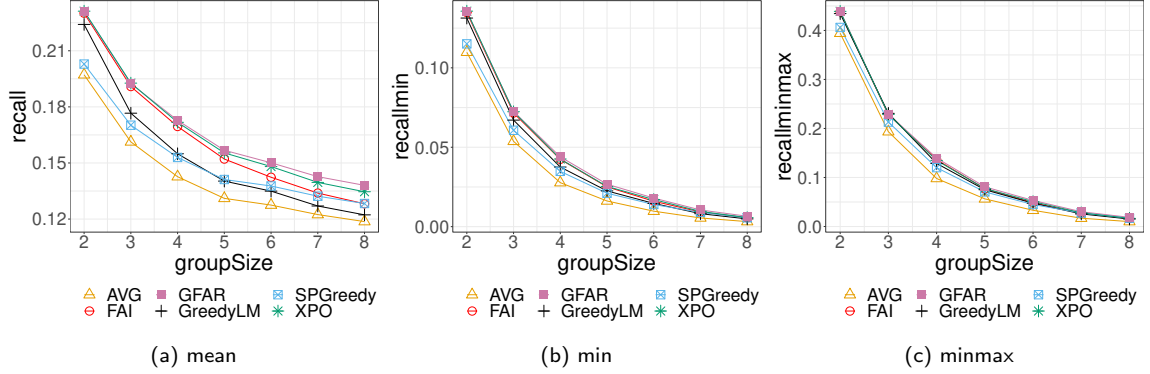

Fig. 1. MovieLens dataset, Recall@20 (mean, min, minmax) for varying group size, for *Random* groups.

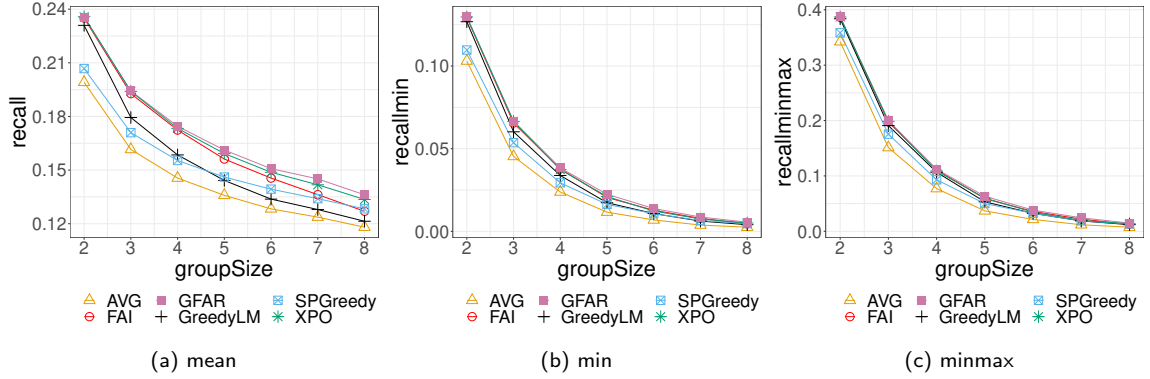

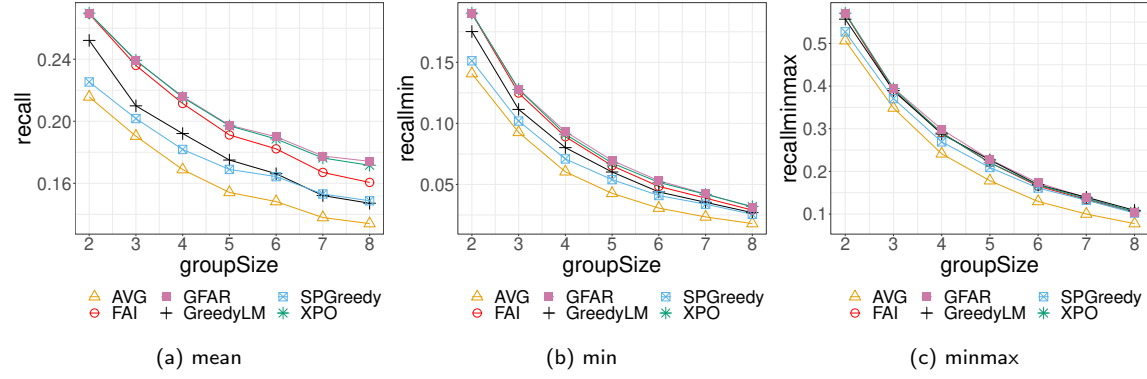

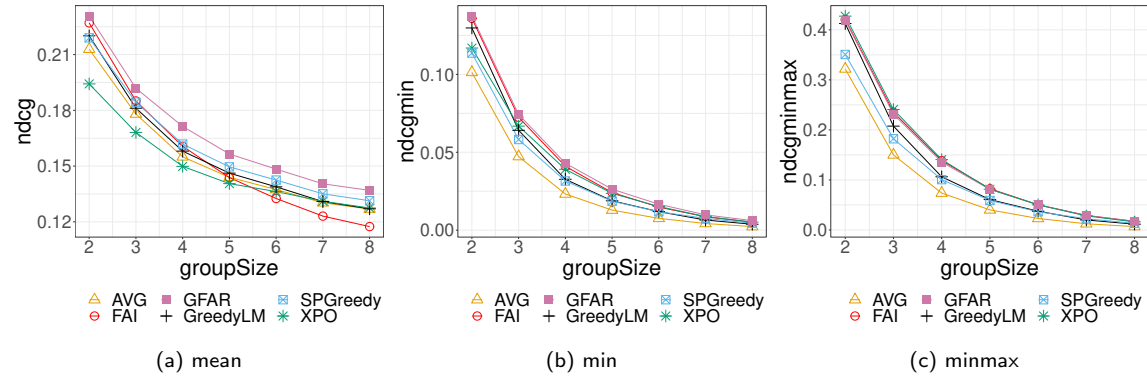

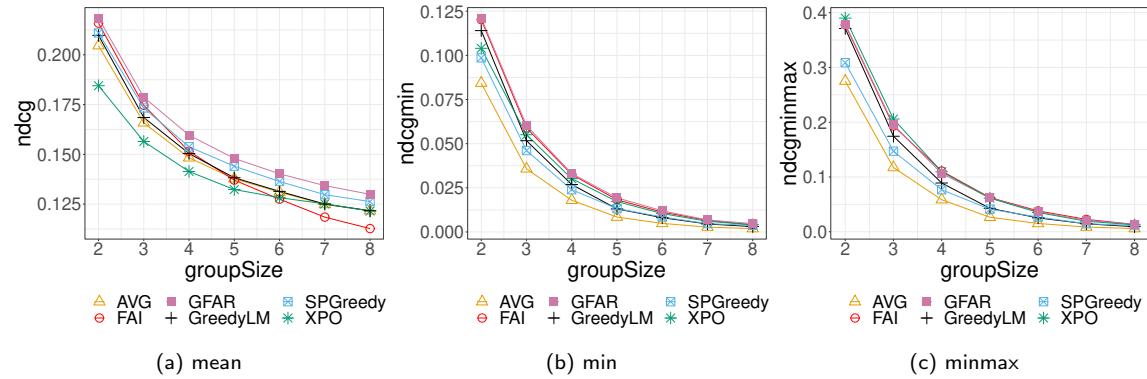

Fig. 2. MovieLens dataset, Recall@20 (mean, min, minmax) for varying group size, for *Divergent* groups.

- For nDCG metric, Figs. 13, 14 and 15 show the mean, min, minmax results for *Random*, *Divergent* and *Similar* groups respectively.
- For DFH metric, Figs. 16, 17 and 18 show the mean, min, minmax results for *Random*, *Divergent* and *Similar* groups respectively.
- Tables 7, 8, 9, 10, 11, 12 shows all the results in table format for *Random*, *Divergent* and *Similar* groups, for group sizes $m = 2, 3, \dots, 7$ respectively.

Similar to MovieLens dataset, for comparison we also include an analysis of MAX strategy. For the KGRec-Music dataset, generally, GFAR outperforms MAX. However, MAX outperforms GFAR for 6 out of 210 configurations: *Random* groups of size 2,3,4 for the nDCG(mean) metric; *Divergent* groups of size 2,3,4 for the nDCG(mean) metric. We note however the nDCG(mean) is slightly higher, MAX performs much worse for nDCG(min) and nDCG(minmax), suggesting it is not a suitable fairness strategy as predicted.

Table 1. MovieLens dataset: Results when group size $m = 2$. For each group type, the best result for each metric is highlighted in **bold**. If the best result is achieved by GFAR, the second best is marked with \star ; otherwise GFAR is marked with \star . The metrics for the **best result** are also marked with ι if the results are statistically significant with respect to the approach marked with \star . (Paired t-test with $p < 0.05$, with Bonferroni correction)

Table 11. KGRec-Music dataset: Results when group size $m = 6$. For each group type, the best result for each metric is highlighted in **bold**. If the best result is achieved by GFAR, the second best is marked with \star ; otherwise GFAR is marked with \star . The metrics for the **best result** are also marked with ι if the results are statistically significant with respect to the approach marked with \star . (Paired t-test with $p < 0.05$, with Bonferroni correction)
